ALLIANCE LTD

INDUSTRY GUIDELINE  
MOBILE NUMBER PORTABILITY-  
IT SPECIFICATION  
PART 3: COMMON NETWORK  
G573.3:2010

## **G573.3:2010 Mobile Number Portability - IT Specification Part 3: Common Network**

First published as ACIF G573.3:2001  
Second edition as ACIF G573.3:2003  
Third edition as ACIF G573.3:2004 Sept  
Fourth edition as ACIF G573.3:2004  
Fifth edition as G573.3:2009

**Communications Alliance Ltd (formerly Australian Communications Industry Forum Ltd) was formed in 2006 to provide a unified voice for the Australian communications industry and to lead it into the next generation of converging networks, technologies and services.**

### **Disclaimers**

- 1) Notwithstanding anything contained in this Industry Guideline:
  - a) Communications Alliance disclaims responsibility (including where Communications Alliance or any of its officers, employees, agents or contractors has been negligent) for any direct or indirect loss, damage, claim, or liability any person may incur as a result of any:
    - i) reliance on or compliance with this Industry Guideline;
    - ii) inaccuracy or inappropriateness of this Industry Guideline; or
    - iii) inconsistency of this Industry Guideline with any law; and
  - b) Communications Alliance disclaims responsibility (including where Communications Alliance or any of its officers, employees, agents or contractors has been negligent) for ensuring compliance by any person with this Industry Guideline.
- 2) The above disclaimers will not apply to the extent they are inconsistent with any relevant legislation.

# 1 GENERAL

## 1.1 Purpose

The purpose of this document is to define technical specifications and other requirements associated with interfacing between Participants and the PIPN provider.

## 1.2 Scope

This document specifies the requirements of the Private IP Network (PIPN) to provide interconnectivity which facilitates Mobile Number Portability.

The PIPN will be used to support Mobile Number Portability and other uses as approved by the Electronic Information Exchange Management Committee (EIEMC).

<p><i>NOTE: For EEnet purposes please refer to <b>EIE Infrastructure Common Network Specification (G608:2004)</b>.</i></p>
--

## 1.3 2009 Revision

In 2009, the Mobile Number Portability Code was revised. At that time all associated Mobile Number Portability documents were republished as Communications Alliance documents to reflect the change of organisational name from ACIF. Where relevant any references to other documents have also been updated.

## 1.4 2010 Revision

In 2010, a minor revision was conducted to enhance current guidance on fault management processes and diagnostics in order to better address MNP fault scenarios arising from connectivity issues.

## 2 REVIEW PERIOD

This Guideline will be reviewed in conjunction with *Mobile Number Portability* Industry Code (C570:2009), or when either the current PIPN provider changes, or additional IP network providers want to connect to the PIPN.

## 3 ACRONYMS AND DEFINITIONS

### 3.1 Acronyms

For the purposes of this Guideline, the following acronyms apply:

**ATM**

Asynchronous Transfer Mode

**BGP**

Border Gateway Protocol

**CSP**

Carriage Service Provider

**DNS**

Domain Name Server

**DSL**

Digital Subscriber Line

**EIERP**

Electronic Information Exchange (Inter-Operator) Reference Panel

**IP**

Internet Protocol

**IPSec**

IP Security

**ISDN**

Integrated Service Digital Network

**MC**

Management Centre

**MNP**

Mobile Number Portability

**NMC**

Network Management Centre

**OSPF**

Open Shortest Path First

**PIPN**

Private IP Network

**PSD**

Prime Service Deliver

**PSS**

Portability Service Provider

**PVC**

Permanent Virtual Channel

**RIP**

Routing Internet Protocol

**SLA**

Service Level Agreement

**WAN**

Wide Area Network

**3.2 Definitions**

For the purposes of this Guideline, the following definitions apply:

***Act***

means the *Telecommunications Act 1997*.

***Bilateral Agreements***

means any agreement between two parties.

***Carrier***

has the same meaning as in the *Act*.

***Participant***

means those parties involved in MNP including any Carrier, CSP or PSS that interconnects with the PIPN to either send or receive MNP transactions, or who use the PIPN for a purpose authorised by the EIEMC.

***Private IP Network***

means a transmission network that interconnects all Participants and provides a common network layer service.

***Portability Service Supplier***

means a Carrier or CSP or their agent or a contractor who provides supporting services to Carriers and/or CSPs in the provision and operation

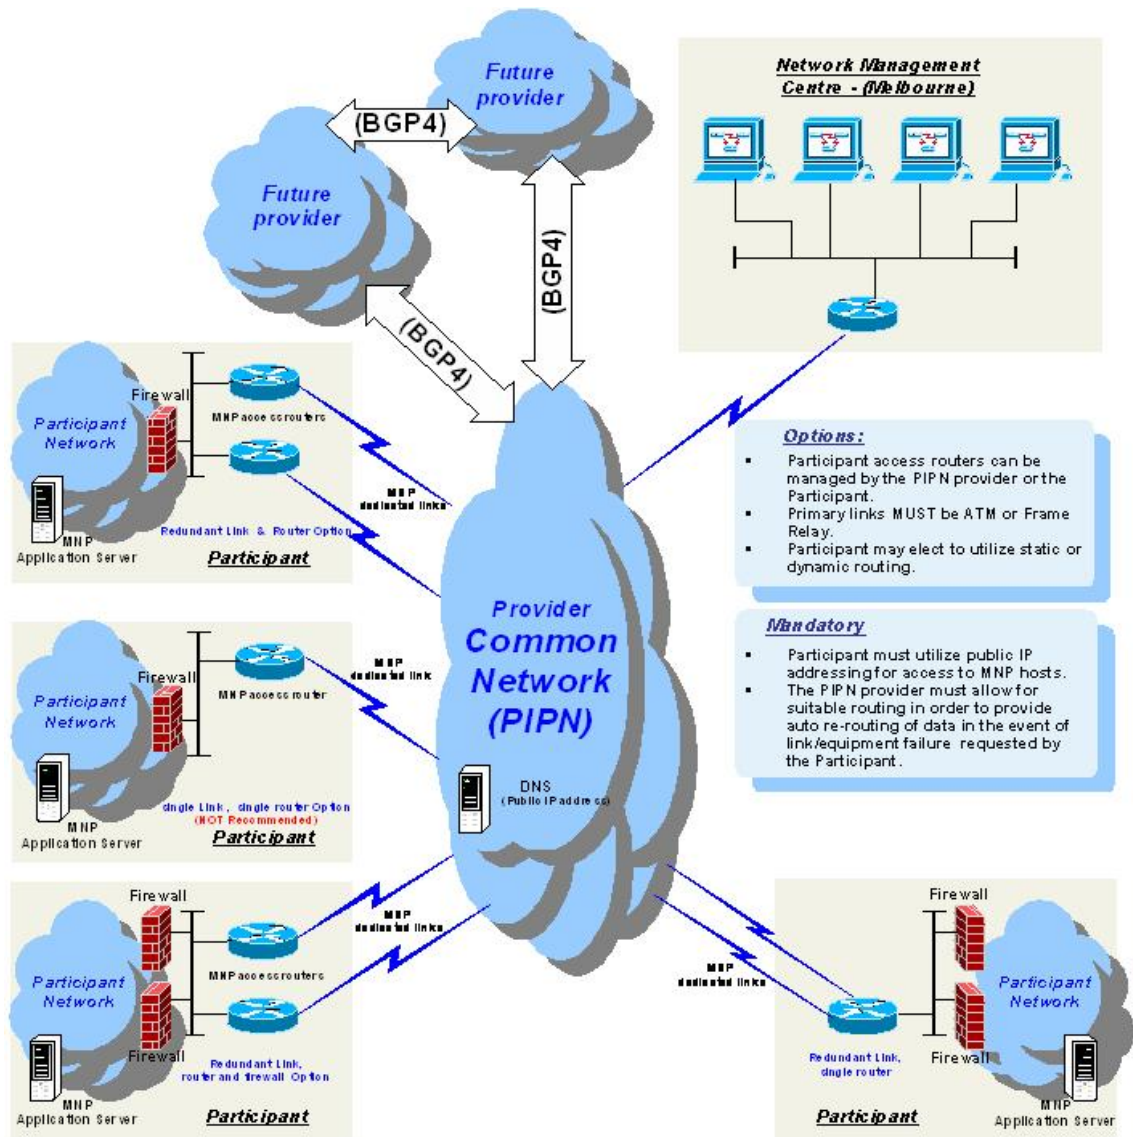

of MNP. For example, Port administration services, Ported number reference databases and network services for call.

## 4 MNP COMMON NETWORK

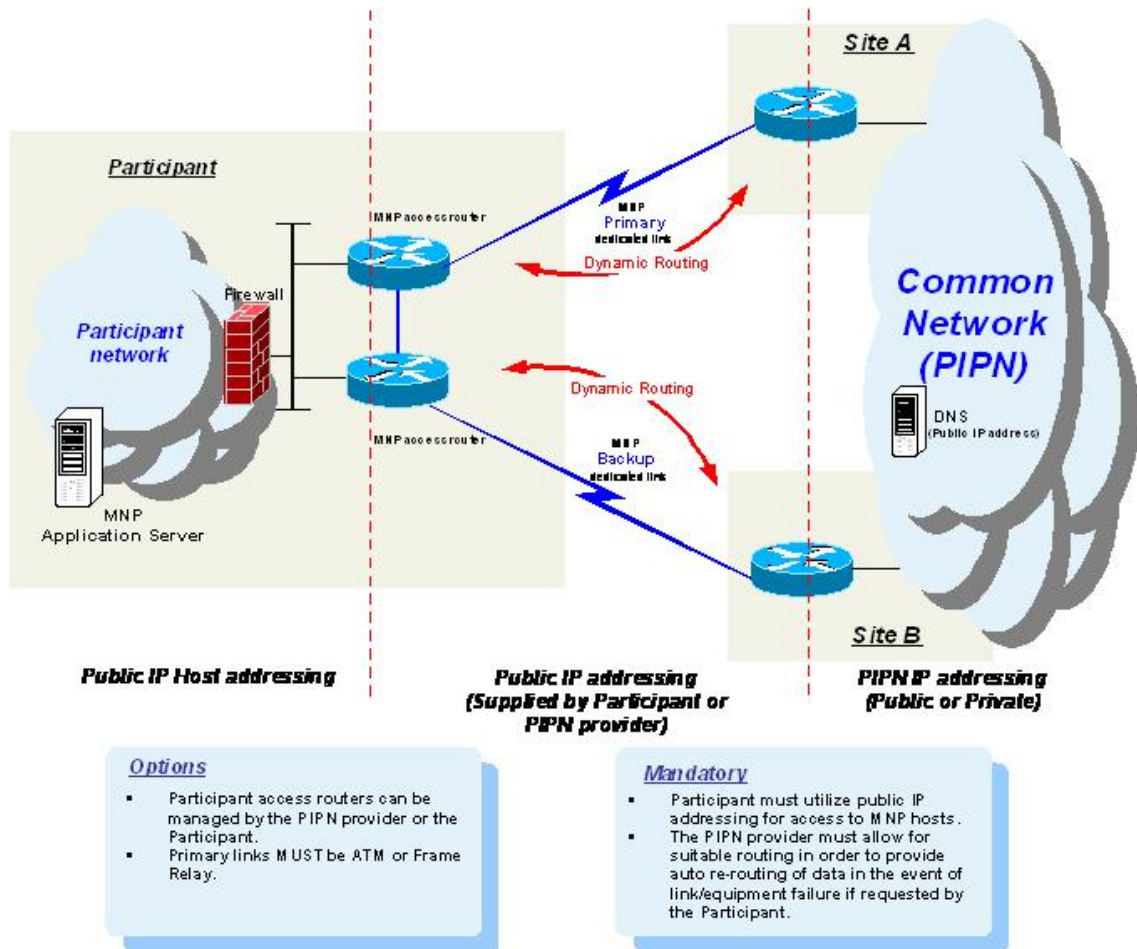

The common network infrastructure is an electronic messaging platform that allows Participants to exchange information electronically with each other, in order to perform business functions associated with MNP and other uses approved by the EIEMC.

Currently there is only one provider offering a single PIPN. The PIPN may be provided using one or more network providers. Should a multiple provider PIPN model be adopted in the future, the PIPN must provide seamless and transparent interconnection between any and every Participant.

**FIGURE 1**

Private IP network diagram – Phase 1

**FIGURE 2**

**Recommended Participant interface to PIPn with dynamic routing**

**4.1 Access**

The PIPn is a communications medium that is only available to those parties approved by the MNP Administration Group, for MNP purposes; or by the Electronic Information Exchange Management Committee, for EInet purposes.

The PIPn provider must not provide access to the PIPn to a potential Participant without the written consent of the:

- (a) MNP Administration Group, for MNP purposes; or
- (b) Electronic Information Exchange Management Committee, for EInet purposes.

## 4.2 Types of Transmission Link

The primary links between the PIPN provider's routers and the Participant's access routers must be ATM or Frame Relay. ISDN may be used as the backup link but is not recommended as the primary link.

The primary links must be dedicated to meet the service levels as defined in the *Mobile Number Portability* Industry Code (C570:2009). This will be determined by agreements between the Participant and the PIPN Provider.

Participants will make arrangements with a PIPN Provider for network and routing dimensioning needs (for example bandwidth, number of PVCs).

## 4.3 Interconnection

4.3.1 **Network Provider to Network Provider:** Border Gateway Protocol (BGP4) must be used as the base routing protocol for interconnection of PIPNs.

4.3.2 **Participant to Network Provider:** Each Participant will access the PIPN through the access router located on the Participant's premises. The Participant's access router(s) can be managed either by the PIPN provider or by the Participant themselves.

A Participant may elect to use static or dynamic routing between themselves and the PIPN.

For maximum compatibility, proprietary network routing protocols (for example, IGRP, EIGRP) must not be used.

4.3.3 **Channels and associated MNP priority scheme:** For MNP the PIPN provider's network and the Participant's router must provide for three priority schemes. The three priority schemes include the Production, Testing and Administration channels.

A priority scheme must be implemented in the PIPN provider's network for handling of the queues associated with these MNP Channels with the Production channel having the highest priority.

The implementation of the MNP priority scheme must be negotiated between the Participant and their PIPN provider.

Where other applications associated with the EIEnet are authorised (subject to Clause 5.1) for use on the PIPN, they must be on separate channels to those used for MNP, and must not have any impact on any MNP channel or priority scheme.

4.3.4 **Common network equipment and associated protocols:** Participants (that manage their own routers) must choose a router protocol that is compatible with that of the PIPN.

#### **4.4 IP Addressing**

MNP application servers and Participant's access routers must be addressable using public IP addresses. Where the Participant does not supply the Public IP addresses then their PIPN provider may supply them.

Within the PIPN, public or private IP addresses may be used.

For IP protocol selection and maintenance, IP v4 is the protocol of choice. Any change of standard (e.g. IP v6) must be coordinated through Communication Alliance.

#### **4.5 Setup of Firewall**

A firewall must be used in the Participant's network. The firewall must be capable of passing both way traffic based on the IP addresses of all Mobile Carriers and Mobile CSPs, PSSs and PSDs (estimated to be 37 parties). In the case of multiple IP network providers to the PIPN, the Participant's MNP application server must be able to communicate with MNP application servers of other Participants with different IP network providers.

#### **4.6 Domain Name System (DNS)**

The PIPN must provide a central DNS service capability. In the case of multiple IP network providers to the PIPN the provision of the DNS service capability must be determined by the PIPN providers. The DNS service must have a Public IP address.

#### **4.7 Network Security**

Security is provided at the application level and the messages will be encrypted when transacting through the common network, as specified in *Mobile Number Portability IT Specification - Part 2: Architecture and Messaging Requirements* (G573.2:2009).

#### **4.8 Network Scalability**

The network solution must be scalable to be able to carry actual volumes, and agreed forecasts, of Mobile Number Portability transactions.

## 5 DATA LINK REDUNDANCY

It is highly recommended that Participants subscribe to a back-up link to an alternative physical path. This is to be addressed through commercial agreement between each Participant and a nominated PIPN supplier. The PIPN must be able to provide recovery from single point of failure situations.

In the case of multiple IP network providers, Participants may arrange back-up links in two ways:

- by subscribing to multiple IP network providers; or
- by having fully redundant (and, where possible, diversely routed) links to different locations of a single IP network provider.

It is envisaged the Participant can subscribe to multiple PIPN providers, or have fully redundant links to the single provider at different physical locations.

In the event of any single point of failure in one PIPN provider, the Participant access router can be auto-configured to pass the IP traffic to the alternative PIPN provider through the back-up link. The back-up link is shown in Figure 1 and Figure 2.

### 5.1 Availability

The standard availability target for the PIPN Provider is 99.85%.

The following service performance objectives apply to PIPN Providers:

Class of Service	Standard
Data Delivery Ratio %	99.90%
Network Availability %	99.98%
Round Trip Transit Delay (milliseconds maximum)	100
Packet Delay Variation (milliseconds maximum)	20

Availability targets are averaged over a one calendar month period. All targets apply within the Private IP network and do not include access services. Planned outages are excepted.

### 5.2 Planned Outages

In the event that a PIPN Provider needs to carry out maintenance on the PIPN they must notify each Participant and other PIPN providers as per pre-established Bilateral Agreements. Should maintenance be required industry co-ordination and agreement with respect to scheduling the planned outage must be in place before the planned outage is carried out.

## **6 COMMERCIAL OFFERING**

The access to the PIPN will be provided to Participants on a commercial basis.

## **7 FAULT MANAGEMENT**

### **7.1 Fault Management Principles**

- 7.1.1 The PIPN must provide self-diagnostic capability to identify faults in the PIPN network. The self-diagnostic capability includes the ability for Participants to 'ping' and 'trace-route' to other Participants access routers and edge routers.
- 7.1.2 The results of the 'ping' and 'trace-route' data should be made available to other Participants upon request via the standard operational escalation path following due diligence in assessing any other factors which may be contributing to connectivity issues, including firewall and application server troubleshooting. A connectivity issues checklist is provided as an appendix to this guideline at Appendix A1.
- 7.1.3 The PIPN provider must provide a contact list for the reporting and escalation of faults. This will be established under Bilateral Agreements.
- 7.1.4 Restoration times depending on the severity of the fault must be documented.
- 7.1.5 Fault Management procedures and Service Levels must be agreed between the Participant and the PIPN Provider.

### **7.2 Participant and PIPN Provider Responsibilities**

Participants and PIPN provider(s) are both responsible for ensuring that appropriate arrangements are agreed between themselves for PIPN fault management procedures.

## 8 MINIMUM PARAMETER VALUES

Parameter	Value of [x]
ATM Access Speeds	2Mbps to 34Mbps
Frame Relay Access Speeds	64Kbps to 2Mbps
ATM Physical Interfaces	ATM-UNI 3.1
Frame Relay Physical Interfaces	V.35, X.21, and G.704
Message Volume (See Note 1)	Est. 220,000 Messages per 10 hour day
Average Message Length	4 KBytes
Effective Throughput	10 KBytes/sec
End-to-End Delay	50 milliseconds
Annual Planned Outage Occurrence	12
Planned Outage Length	8 Hours
Network Availability	99.85%

*NOTE 1: This will only be used for the purposes of providing MNP*

## APPENDIX

### A Fault Management Diagnostics

#### A1 Connectivity Issues Checklist

Checklist Step	Recommended Action
1	Check for any relevant network alarms through alarm browser
2	Perform an end to end test to attempt to replicate the fault (ping/trace/telnet via a specific port)
3	Test your own network end to end from demarcation point back to the source/destination and vice versa (via ping/trace/telnet via specific port)
4	If fault can be replicated in own network, check each hop between the source, destination and edge for a fault condition using the following steps: <ul style="list-style-type: none"><li>▪ Start at one end with trace</li><li>▪ Check device logs for interface or hardware failures</li><li>▪ Ping/trace, telnet via specific port from each device</li><li>▪ Interrogate routing on each device being investigated</li></ul>
5	Check logs of any traversed firewalls for dropped packets between source and destination
6	Setup TCP//IP dump/packet snoop and perform end to end testing if needed
7	Look for possible firewall rule problem
8	Check POI between carriers for interface status and/or errors
9	Check and validate routes into and from the other carriers neighbouring router
10	Ping/trace into the other carrier's network
11	Check for incoming/outgoing packets between participants via edge router interface

## **PARTICIPANTS**

The Working Committee responsible for the revisions made to this Guideline consisted of the following organisations and their representatives:

<b>Organisation</b>	<b>Representative</b>
Vodafone Hutchison Australia	Alexander R, Osborne
Telstra	Jim Coburn
AAPT /Powertel	Geoff Brann
Optus	David Bolton
Paradigm.One	Dev Gupta
Primus	Martin Vella
Buroserv	John Green

This Working Committee was chaired by Alexander R. Osborne. Visu Thangavelu of Communications Alliance provided project management support.

Communications Alliance was formed in 2006 to provide a unified voice for the Australian communications industry and to lead it into the next generation of converging networks, technologies and services.

In pursuing its goals, Communications Alliance offers a forum for the industry to make coherent and constructive contributions to policy development and debate.

Communications Alliance seeks to facilitate open, effective and ethical competition between service providers while ensuring efficient, safe operation of networks, the provision of innovative services and the enhancement of consumer outcomes.

It is committed to the achievement of the policy objective of the *Telecommunications Act 1997* - the greatest practicable use of industry self-regulation without imposing undue financial and administrative burdens on industry.
