Recommendation I.231 Part E.2**STAGE 1 SUPPLEMENTARY DESCRIPTION 64 Kbit/s CIRCUIT-MODE BEARER
SERVICE CATEGORIES***(Melbourne, 1988)***General**

This document forms part of the Australian Communications Industry Forum (ACIF) G.500 signalling protocol specification for interconnection services to be used in the Australian domestic network.

This suite of Documents is based on the ITU-T Recommendation(s) referenced below. The ITU retains all right, title and interest, including copyright, in its Recommendations and any subsequent revisions. ACIF is solely responsible for the accuracy of the reproduction of ITU materials in this Document. Any reference to an ITU-T Recommendation is accurate at the time of publication of this Document. Since the referenced ITU-T Recommendations may be revised at any time, users of this Document may want to contact the ITU to determine whether the reference is still current.

For further information concerning ITU-T Recommendations, the user may contact:

ITU Sales and Marketing Service
Place Des Nations - CH-1211 GENEVA 20 Switzerland
E-mail: sales@itu.int

This document is based on ITU-T recommendation I.231 (1988). This document is a modification of ITU-T recommendation I.231 which has been customised to suit Australian network requirements.

Participants

The ACIF group (Network Reference Panel: Working Committee #7 "Signalling and Interconnect Dial Plan") that developed this document consisted of the following companies and representatives:

<u>Representative</u>	<u>Company / Organisation</u>	
Gary McLaren	Siemens	Chairperson
Alan Arthurell	Alcatel	Secretary
Sam Fois	Telstra	Interconnection Implementation Plan Editor

Introduction

This document specifies the requirements for the implementation of the ACIF G.500 specification based on ITU-T recommendation I.231.

References

ITU-T Recommendation I.231 Circuit-Mode Bearer Service Categories (1988).

ITU-T Recommendation I.210 describes the principles for defining telecommunication services supported by an ISDN including the concept of bearer services, teleservices and supplementary services. It also provides the means for the definition and description of such services. A recommended set of circuit-mode bearer services categories is defined in ITU-T Recommendation I.230.

The purpose of this Recommendation is to describe circuit-mode bearer service categories, to describe individual circuit-mode bearer services, and to recommend their provision in ISDN. The definitions and descriptions form the basis to define the network capabilities required for the support of the services in ISDN.

Bearer service categories are described by prose definitions and descriptions, by attributes and their values and by dynamic descriptions following the description method given in ITU-T Recommendation I.130. The application of the attribute technique and the definitions of these attributes and attribute values is given in ITU-T Recommendation I.140.

The following set of bearer service categories is currently identified and more may be identified in the future.

~~I.231.1~~ Part E-2 Circuit-mode 64 kbit/s unrestricted, 8 kHz structured bearer service category

~~I.231.2~~ Part E-7 Circuit-mode 64 kbit/s, 8 kHz structured bearer service category usable for speech information transfer

~~I.231.3~~ Part E-1 Circuit-mode 64 kbit/s, 8 kHz structured bearer service category usable for 3.1 kHz audio information transfer

~~I.231.4~~ Circuit-mode, alternate speech / 64 kbit/s unrestricted, 8 kHz structured bearer service category

~~I.231.5~~ Circuit-mode 2×64 kbit/s unrestricted, 8 kHz structured bearer service category

~~I.231.6~~ Circuit-mode 384 kbit/s unrestricted, 8 kHz structured bearer service category

~~I.231.7~~ Circuit-mode 1536 kbit/s unrestricted, 8 kHz structured bearer service category

~~I.231.8~~ Circuit-mode 1920 kbit/s unrestricted, 8 kHz structured bearer service category

1 I.231.1 - Circuit-mode 64 kbit/s unrestricted, 8 kHz structured bearer service category (Note 1)

1.1 Definition

This bearer service category provides unrestricted information transfer between S/T reference points, it may, therefore, be used to support various user applications. Examples include:

- speech (Note 2);
- 3.1 kHz audio (Note 2);
- multiple subrate information streams multiplexed into 64 kbit/s by the user;
- transparent access to an X.25 public network [Recommendation I.462 case a)].

User information is transferred over a B-channel, signalling is provided over a D-channel.

Note 1 — During an interim period some networks may only support restricted 64 kbit/s digital information transfer capability, i.e. information transfer capability solely restricted by the requirement that the all-zero octet is not allowed. For interworking the rules given in Appendix I of ITU-T Recommendation I.520 should apply. The interworking functions have to be provided in the network with restricted 64 kbit/s capability. The ISDN with 64 kbit/s transfer capabilities will not be affected by this interworking other than by conveying the appropriate signalling message to and from the ISDN terminal.

Note 2 — Whilst speech and 3.1 kHz audio have been given as applications for this bearer service category, it is recognized that it is the responsibility of the customers to ensure that a compatible encoding scheme is in operation. Customers should also recognize that no network provision can be made for the control of such items as echo and loss, as the network is unaware of the application in use. Furthermore, the Quality of Service attribute value for information transfer delay will indicate the suitability of a particular version of this bearer service for speech.

1.2 Description

1.2.1 General description

This circuit-mode bearer service category allows:

- two users (e.g. terminals, PABXs) in a point-to-point configuration to communicate via the ISDN using 64 kbit/s digital signals over the B-channel, in both directions continuously and simultaneously for the duration of call;
- three or more users in a multipoint configuration (refer to Recommendation I.254 for the supplementary service description on Three-Party Service and Conference Calling).

The 64 kbit/s bearer service category does not require the use of any new numbers or codes.

No additional network interconnection information specific to this bearer service category, is required in the call set-up process.

Selection of this bearer service category may be explicitly supported by an Integrated Services Digital Network (ISDN) or a GSM Mobile network. In these cases the relevant ITU-T ISDN DSS1 or GSM standard for selecting this bearer service category must be applied.

1.2.2 Specific terminology

Retention timer: this timer specifies the amount of time that the network retains the call information of the original call upon encountering busy or being released. It is a network provider option. The value for this timer is greater than 15 seconds.

1.3 — Procedures

1.3.1 — Provision/withdrawal

1.3.1.1 — Provision of this service will be by pre-arrangement with the Administration.

1.3.1.2 — This bearer service is offered with several subscription options which apply separately to each ISDN number or group of ISDN numbers on the interface. For each subscription option, only one value can be selected. Subscription options for the interface are summarized below:

<i>Subscription option</i>	<i>Value</i>
Maximum number of information channels available at user B	$-m$, where m is not greater than the number of information channels on the interface
Maximum number of total calls present at user B	$-n$, where n is not greater than the number of information channels on the interface

User B can be an ISDN number or group of ISDN numbers on the interface.

Note — More than one ISDN number can be associated with the service/interface only as a part of a supplementary service such as multiple subscriber number. In the case of one ISDN number, the option given above for the number of calls can only exceed the number of information channels in association with a supplementary service (e.g. call waiting). As a network provider option, separate values may be specified for incoming and for outgoing calls for either or both of the limits.

1.3.2 — Normal procedures

All user-network signalling is done on the D-channel.

a) — Originating the service (call set-up)

The call is originated by the user requesting from the network the required bearer service; the request includes a number identifying the called user. Other information, as required, for the bearer service and for use by the network in supplementary services provided to the called user (e.g. calling line identity) may also be included. This request may be given to the network either *en bloc*, containing all the required information, or not *en bloc*.

b) — Indications during call set-up

After initiating a call the calling user will receive an acknowledgement that the network is able to process the call. The called user will receive an indication of the arrival of an incoming call of this bearer service.

The calling user shall also be given an indication that the incoming call is being offered to the called user, when an indication is received by the network that the called user is being informed of this call. When the call reaches the called user and the connection is established, an indication of this is sent to the calling user.

The called user may also provide other information for use by the network in supplementary services provided to other users (e.g. connected line identity). The relationship of a connected user with the called user requires further study.

Once established, the B-channel is then available for the transmission of 64 kbit/s digital signals in both directions continuously and simultaneously, without alteration by the network. No restriction is placed by the network on the content of the digital signals (see Note 1 of § 1.1).

e) *Terminating the call*

The call may be terminated by either or both of the users by indicating this to the network. If one user terminates the call, an appropriate indication is sent to the other user.

1.3.3 *Exceptional procedures*

a) *Failure situations due to user error*

i) A user inputting a network-identifiable, improper service request will be given an appropriate failure indication by the network and the call set-up will be ceased.

ii) A user inputting a non-valid network number will be given an appropriate failure indication by the network and the call set-up will be ceased.

b) *Failure situations due to called user state*

i) A calling user attempting to establish a call to a user who is identified by the network to be busy (either network-determined user busy or user-determined user busy) will be given an appropriate failure indication by the network.

ii) A user attempting to establish a call to a user whose terminal equipment fails to respond will be given an appropriate failure indication by the network and the call set-up will be ceased.

iii) On a call to a user whose terminal equipment has responded that the called user is being informed of the call but has failed to answer within a defined period of time, the calling user attempting to establish the call will be given an appropriate failure indication by the network and the call set-up will be ceased.

c) *Failure situations due to network conditions*

A user attempting to establish a call but meeting call failure situations due to network conditions (e.g. congestion) will be given an appropriate failure indication by the network.

d) *Failure situations due to called user state and/or network conditions*

A user attempting to establish a call but meeting call failure situations due to network conditions (e.g. congestion) or called user state (e.g. busy) can have service data retained for a specified period of time, i.e. retention timer.

1.3.4 *Alternative procedures*

1.3.4.1 *Reserved service procedures*

For further study.

1.3.4.2 *Permanent service procedures*

For further study.

1.4 *Network capabilities for charging*

This Recommendation Specification does not cover charging principles. Future Recommendations in the D-Series are expected to contain that information.

1.4.1 *Demand service charging*

It shall be possible to charge the subscriber accurately for the demand service.

1.4.2 *Reserved service charging*

It shall be possible to charge the subscriber accurately for the reserved service.

1.4.3 *Permanent service charging*

It shall be possible to charge the subscriber accurately for the permanent service.

1.5 *Interworking requirements*

Interworking between the ISDN and networks referred to as "digital PSTNs", pre-ISDNs, pilot-ISDNs or extended IDNs as well as between the ISDN and PSTNs may be required for this bearer service category.

In advance of the provision of the ISDN, similar services supported by 64 kbit/s connectivity will be available to customers by RPOAs/network operators on what may be described as "digital PSTNs", pre-ISDNs, pilot-ISDNs or extended IDNs. Interworking with ISDN customers will therefore be required. To effect this, as a broad guideline, RPOAs/network operators need to ensure these networks have the necessary functionality at the interworking point to provide service connectivity with the ISDN.

A V-Series terminal connected to the ISDN via a terminal adaptor and using the 64 kbit/s unrestricted bearer service requires the use of an IWF (including a modem) in the network for calls to PSTN users. To effect the connection, a 64 kbit/s connection would need to be used to the IWF (interworking function) and a 3.1 kHz audio or equivalent connection would then need to be used to the PSTN user.

1.6 *Interaction with supplementary services*

Not applicable. Each supplementary service description identifies the applicability to this bearer service category.

1.7 *Attributes and values of attributes of the circuit-mode 64 kbit/s unrestricted, 8 kHz structured bearer service category*

Information transfer attributes

1. Information transfer mode: circuit
2. Information transfer rate: 64 kbit/s
3. Information transfer capability: unrestricted
4. Structure: 8 kHz integrity
5. Establishment of communication: demand/reserved/permanent
6. Symmetry: bidirectional-symmetric/unidirectional
7. Communication configuration: point-to-point/multipoint

Access attributes

8. Access channel: B for user information,
D for signalling (Note)
9. Access protocol: I-Series for D-channel

General attributes

10. Supplementary services provided: Refer to Recommendation I.250
 11. Quality of Service
 12. Interworking possibilities
 13. Operational and commercial aspects
- } for further study

Note – For reserved/permanent service the operational administrative and maintenance (OAM) messages related to these services may be conveyed over the D-channel.

1.8 — *Provision of individual circuit-mode 64 kbit/s unrestricted, 8 kHz structured bearer services*

- a) — Overall provision¹⁾: E
- b) — Variations of secondary attributes:

<i>Establishment</i>	<i>Symmetry</i>	<i>Communication</i>	<i>Provision¹⁾</i>
<i>of communication</i>		<i>configuration</i>	

I.231.1/1	demand	} bidirectional	pt-pt	E
I.231.1/2	reserved		pt-pt	A
I.231.1/3	permanent		pt-pt	E
I.231.1/4	demand	} unidirectional	pt-pt	A
I.231.1/5	reserved		pt-pt	A
I.231.1/6	permanent		pt-pt	A
I.231.1/7	demand	} bidirectional	multipt	A
I.231.1/8	reserved		multipt	A
I.231.1/9	permanent		multipt	A
I.231.1/10	demand	} unidirectional	multipt	A
I.231.1/11	reserved		multipt	A
I.231.1/12	permanent		multipt	A

- e) — Access

Signalling and OAM (Note 1)		User information		Provision
Channel and rate	Protocols	Channel and rate	Protocols	
D(16)	I.451 (Note 2)	B(64)	User-defined	E
D(64)	I.451 (Note 2)	B(64)	User-defined	E

Note 1 — Definition of protocols for OAM is for further study.

Note 2 — Demand services only. Further study for reserved and permanent services.

1.9 — *Dynamic description*

The dynamic description for this service on a demand basis is identical for a number of circuit-mode services and is therefore collectively given in Recommendation I.220.

1) The definition of E (essential) and A (additional) can be found in Recommendation I.230

The Australian Communications Industry Forum Ltd (ACIF) is a communications self-regulatory body established in 1997 by the industry to manage communications self-regulation within Australia.

The primary role of ACIF is to develop and administer Technical Standards, Industry Codes and industry support services that promote both the long-term interest of end-users and the efficiency and international competitiveness of the Australian communications industry.

ACIF is an industry initiative, funded and resourced by the industry, with a membership that encompasses all industry sectors. ACIF comprises a Board, Advisory Assembly, Executive, six standing Reference Panels and a number of task-specific Working Committees.

Technical Standards and Industry Codes are prepared by Working Committees made up of experts from industry, consumer, government, and other bodies. The requirements or recommendations contained in ACIF's published documents are a consensus of views of representative interests and also take into account comments received from other sources.

Care should be taken to ensure that material used is from the current version of the Standard or Code and that it is updated whenever the Standard or Code and is amended or revised. The number and date of the Standard or Code should therefore be clearly identified. If in doubt please contact ACIF.
